

PROJECT REPORT (Week 4)

Project Title: Dungeon Quest RPG

Week 4: Player Character Development

1. Introduction

In Week 4, the main focus was on improving the player character of the Dungeon Quest RPG. The basic player movement was already done in Week 3, so it was not developed again. This week, some new features were added to make the player more useful in the game.

The main work of this week was player character implementation, health system, attack system, and character interaction. A starting menu was also added to make the game easier to start.

2. Objectives

The main objectives of Week 4 were:

- Improve the player character.
- Add a health system.
- Add a basic attack system.
- Add character interaction.
- Add a simple starting menu.
- Make the player system functional.

3. Player Character Implementation

The player character was developed using Java. In the current version, the player is shown as a small blue box inside the dungeon.

The player can move in four directions using the keyboard.

- **W** – Move Up
- **S** – Move Down
- **A** – Move Left
- **D** – Move Right

The player cannot move outside the game area.

4. Health System

A basic health system was added to the player. The player starts with **100 health points**.

The health value is stored in the player class. A damage method was also added so that the health can be reduced when the player takes damage.

It can be improved later by adding enemy attacks, health items, and a proper health bar.

5. Attack System

A basic attack system was added to the player. The **SPACE** key is used for attacking.

The attack system is connected with the enemy objects. This gives the player a way to interact with enemies during the game.

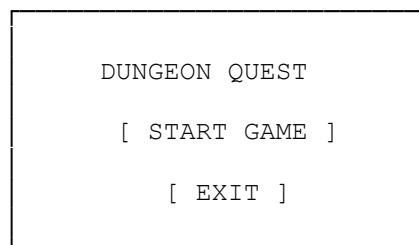

6. Character Interaction

Basic character interaction was also added. The game checks the position of the player and other objects to detect when they are close or touching each other.

This system will be useful for future features such as fighting enemies, collecting items, opening doors, and interacting with objects in the dungeon.

7. Starting Menu

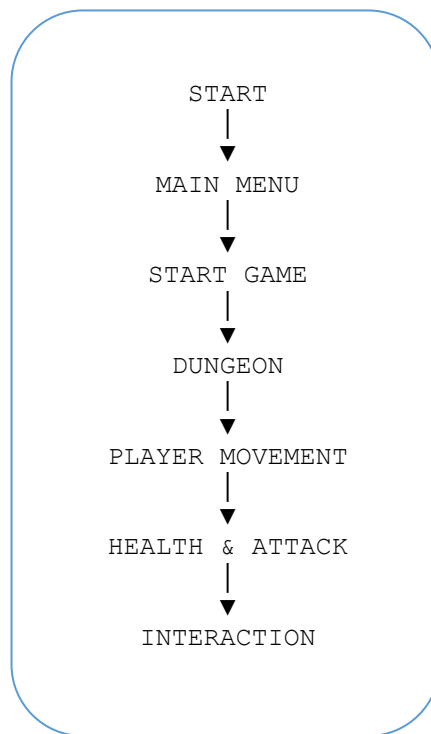

A simple starting menu was added to the game. Before this, the game opened directly to the game screen. Now, the player first sees a starting menu.

By selecting **START GAME**, the player can enter the dungeon.

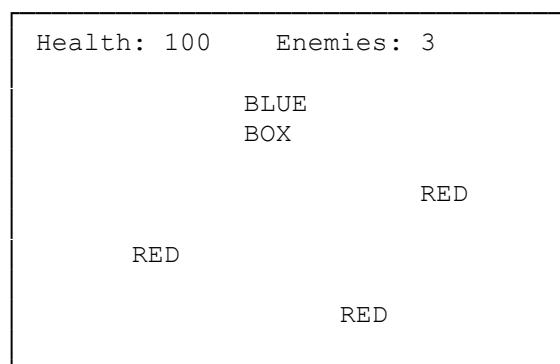

8. Game Flow

The basic game flow of the current version is:

9. Current Game Screen

The game screen is simple at this stage. The dungeon has a black background. The player is shown as a blue box and the enemies are shown as red boxes.

The main purpose of this week was to make the basic player system work. The graphics are kept simple because more game features will be added later.

10. Deliverable

The main deliverable of Week 4 is a **Functional Player System**.

The system includes:

- Player character
- Player movement
- Health system
- Basic attack system
- Character interaction
- Starting menu
- Basic game flow

12. Conclusion

In Week 4, the basic player system of the Dungeon Quest RPG was developed. The player can move inside the dungeon and has basic health, attack, and interaction features. A starting menu was also added.

The game is still a simple version, but the basic player system is now ready. In the next weeks, more features such as better enemies, dungeon objects, items, objectives, and winning or game-over screens can be added.
