

Project Report (Week 3)

Project: Java Dungeon Adventure Game

Week 3: Initial Interface & Dungeon Environment Development

1. Introduction

During Week 3, the initial development of the **Java Dungeon Adventure Game** was started. The main focus was on configuring the development environment, creating the initial Java project structure, developing the basic game interface, and creating a simple dungeon environment.

2. Objectives

The objectives of Week 3 were:

- Configure the Java development environment.
- Create the initial project structure.
- Develop the basic game interface.
- Create the main menu structure.
- Create the game screen.
- Add basic user-interface components.
- Create the initial dungeon environment.
- Develop a basic dungeon scene and background.
- Establish the basic location where the game will take place.

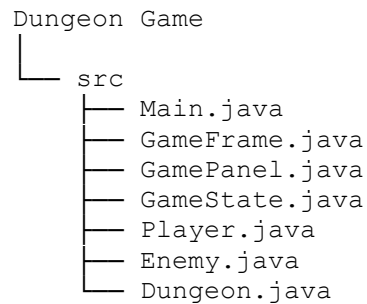

3. Development Environment Configuration

The project was developed using:

Component	Used
Programming Language	Java
IDE	Visual Studio Code
GUI Technology	Java Swing
Graphics	Java AWT
Operating System	Windows

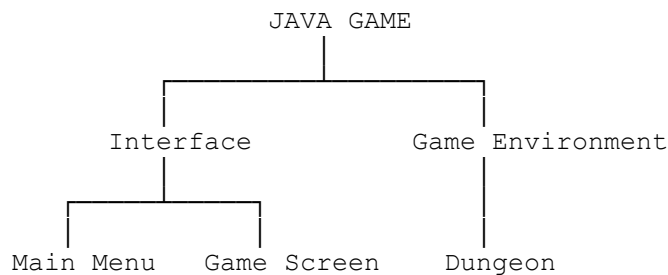

4. Initial Project Structure

The initial project was organized into separate Java classes.

The structure allows different parts of the game to be developed separately.

Basic Structure

5. Interface Development

The initial interface of the game was developed using **Java Swing**.

The interface is divided conceptually into:

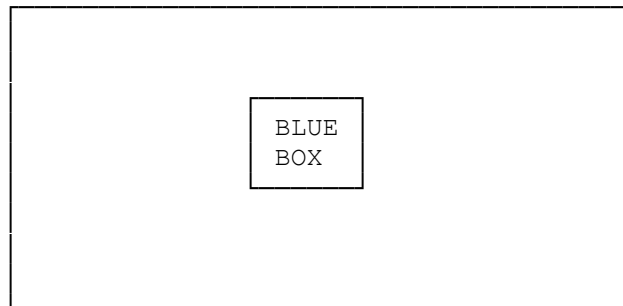

- Main Menu
- Game Screen
- Basic UI area

The purpose of this stage was to establish the visual structure of the game before adding advanced gameplay mechanics.

6. Game Screen

After entering the game, the player is presented with the basic game screen.

The current screen is intentionally simple:

The **black area** represents the **game/dungeon environment**, while the **blue box** represents the **basic player/location object**.

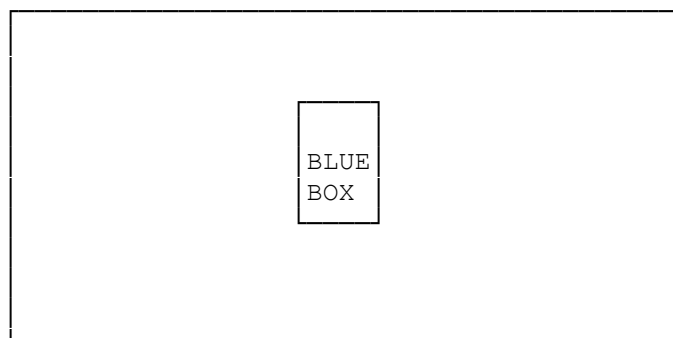

7. Dungeon Environment Creation

The initial dungeon environment was created as a simple game area.

The purpose of this stage was to establish:

- The dungeon background
- The game boundaries
- The basic player location
- The initial scene where future gameplay will take place

Current Dungeon Scene

BLACK = DUNGEON BACKGROUND
BLUE = BASIC PLAYER OBJECT

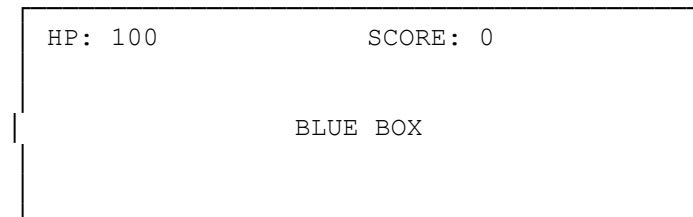

8. Basic User Interface Components

The basic interface was created to provide a foundation for future game development.

Currently, the interface focuses on:

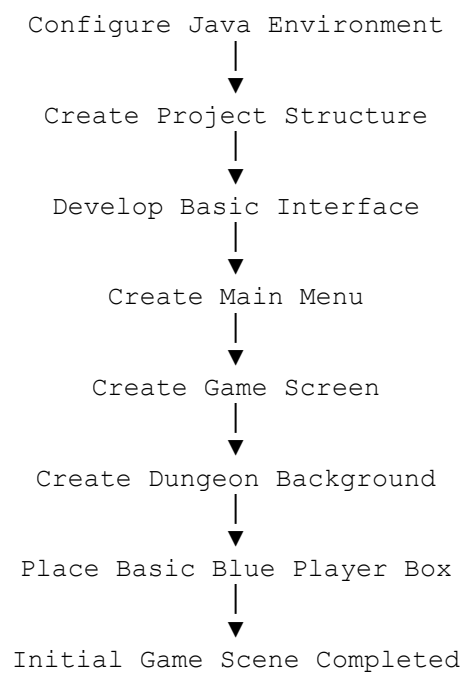

- Game window
- Game area
- Basic visual object
- Background

Future UI components may include:

However, these additional components are **not yet fully implemented** in Week 3.

9. Week 3 Development Flow

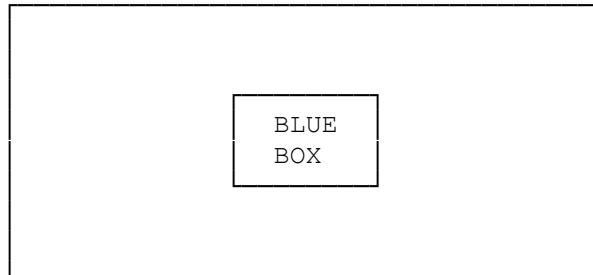

10. Week 3 Result

At the end of Week 3, a basic functional foundation of the game was established.

The current visual result is intentionally simple:

BLACK GAME/DUNGEON AREA

The black background establishes the dungeon/game environment, while the blue box establishes the basic player position.

11. Conclusion

In Week 3, the development environment and initial project structure were successfully configured. The basic interface, game screen, and initial dungeon environment were also created.
