

DUNGEON QUEST RPG

Week 9 & Week 10 Project Report

Final Improvement, Documentation, Testing & Deployment

WEEK 9

Final Improvement & Documentation

1. Game Enhancement

The main focus of Week 9 was to improve the overall quality and appearance of the **Dungeon Quest RPG**.

In the previous weeks, the main gameplay systems were already developed. Therefore, this week was mainly used to make the game look better, feel smoother, and provide a better experience for the player.

Several visual elements were improved, including:

- Green grass background
- Trees and bushes
- Rocks and obstacles
- Flowers and environmental details
- Water area
- Game path
- Designed player character
- Different enemy designs
- Larger boss character
- Weapon and attack effects
- Health and game information display

These improvements made the game environment more attractive and gave it a more complete RPG feeling.

The player and enemies were also designed in a simple **doll-like style**, making the different characters easier to recognize during gameplay.

2. Interface Improvement

The game interface was improved so that the player can easily understand the game status.

The HUD provides important information such as:

- Player health
- XP/experience
- Attack information
- Quest progress
- Remaining enemies
- Game status

The controls were kept simple:

Key	Action
W	Move Up
S	Move Down
A	Move Left
D	Move Right
SPACE	Attack
U	Upgrade Weapon

Simple controls make the game easier to play without requiring complicated instructions.

3. Sound and User Experience

Sound effects were also included to make the gameplay more interactive.

The game contains different sounds for:

- Background music
- Fighting
- Enemy defeat
- Important game events

The sound effects provide feedback to the player when different actions happen in the game.

This improves the overall gaming experience because the player receives both visual and audio feedback.

4. Code Optimization

Another important task of Week 9 was organizing the project source code.

The game was divided into different Java classes according to their responsibilities.

Some important classes are:

- `Main.java` — Starts the game.
- `GameFrame.java` — Creates the main game window.
- `GamePanel.java` — Controls the main gameplay and game screen.
- `Player.java` — Handles the player.
- `Enemy.java` — Handles normal enemies.
- `Boss.java` — Handles the boss character.
- `Dungeon.java` — Manages the dungeon and enemies.
- `Quest.java` — Handles quest progress.
- `AudioManager.java` — Controls game sounds.

Using separate classes makes the project easier to understand, modify, and maintain.

For example, changes related to the player can be handled mainly through the player-related class without changing the complete project.

The source code was also checked for unnecessary problems and possible errors.

5. Game Completion System

A proper game completion system was included in the final version.

The game checks whether the required enemies have been defeated and whether the boss has been defeated.

After the player completes the required objectives, the game enters the **Game Complete** state.

A completion screen is then displayed to clearly show that the player has successfully finished the game.

This makes the game feel more complete because the player receives a clear ending instead of simply returning to the beginning.

6. Documentation Preparation

During Week 9, the final project documentation was also prepared.

The documentation includes information about:

- Project introduction
- Project objectives
- Game features
- Technologies used
- Gameplay system
- Development process
- Testing
- Final improvements
- Deployment

The player needs to:

1. Start the game.
2. Use **W, A, S, D** to move.
3. Use **SPACE** to attack.
4. Defeat the enemies.
5. Complete the required quest.
6. Fight and defeat the boss.
7. Reach the Game Complete screen.

WEEK 10

Final Testing & Deployment

7. Final Testing

The main focus of Week 10 was complete testing of the game before submission.

Different parts of the game were tested to make sure they were working properly.

Player Testing

The following were checked:

- Player movement
- Player health
- Player attack
- Weapon upgrade
- Collision with objects

Enemy Testing

The following were tested:

- Enemy positions
- Enemy health
- Enemy attack
- Enemy defeat system
- Enemy counting

Boss Testing

The boss system was also tested:

- Boss appearance
- Boss health
- Boss battle
- Boss defeat
- Quest completion

Game System Testing

Other important systems were checked:

- Quest progress
- Sound effects
- Background music
- HUD information

- Keyboard controls
- Game completion screen

The game was played multiple times to check for errors and make sure the major features worked correctly.

8. Bug Fixing

During final testing, possible gameplay problems were identified and corrected.

Special attention was given to the **Game Complete** system.

The final version was adjusted so that after the required enemies and boss are defeated, the game stays on the completion state instead of restarting the same battle again.

This gives the player a proper ending after successfully completing the game.

9. Final Project Deployment

After completing the testing and fixing the final issues, the project was prepared as the final playable version.

The final **Dungeon Quest RPG** includes:

- Player movement
- Player health
- Combat system
- Weapon system
- Enemy system
- Boss battle
- Quest system
- XP system
- Weapon upgrade
- Sound effects
- Background music
- RPG-style environment
- HUD
- Game completion system

The required Java files and game resources are kept together so that the game can be run and demonstrated properly.

10. Final Game Showcase

Instead of preparing a separate presentation, the final project will be demonstrated through a **live game showcase**.

During the showcase, the main gameplay features will be demonstrated directly from the final playable version.

The showcase will include:

- Starting the game
- Moving the player
- Exploring the environment
- Fighting enemies
- Using the weapon
- Showing the XP system
- Upgrading the weapon
- Completing the quest
- Fighting the boss
- Defeating the boss
- Showing the Game Complete screen

This allows the complete project to be demonstrated through actual gameplay.

11. Final Outcome

At the end of Week 10, **Dungeon Quest RPG** was completed as a playable RPG game.

The project combines gameplay, graphics, sound, quests, combat, enemies, and a boss battle into one complete game.

The final two weeks mainly focused on **polishing, organizing, testing, documenting, and preparing the game for the final showcase**.

The final version provides a simple RPG experience where the player can explore the environment, fight enemies, gain experience, upgrade weapons, complete quests, and defeat the final boss.

12. Conclusion

Week 9 and Week 10 were the final stages of the Dungeon Quest RPG project.

Week 9 focused on improving the graphics, interface, sound, code structure, game completion system, and documentation. Week 10 focused mainly on complete testing, bug fixing, and preparing the final playable version.

After completing these stages, the game became more organized, attractive, and stable.

The final **Dungeon Quest RPG** is ready to be showcased as a playable Java-based RPG game.

Through this project, we gained practical experience in **Java programming, object-oriented programming, GUI development, game logic, debugging, testing, sound integration, documentation, and game development.**
