

My Learning and Experience from Building Dungeon Quest RPG

Building **Dungeon Quest RPG** was a new and important experience for me because it was my first game project. At the beginning, I thought making a game would be simple, but after starting the project, I understood that there are many small things that need attention. I learned how to use Java to create a game, how different classes work together, and how to manage player movement, enemies, attacks, quests, sound, and game completion.

I also faced many problems during development. Sometimes the code did not run because of small errors. Some features worked differently from what I expected, and I had to test the game again and again. Fixing bugs was sometimes frustrating, especially when one small change affected another part of the game. But these problems taught me to be more patient and careful with my code.

This project also helped me understand that learning programming is not only about writing code. It is also about finding problems and trying different ways to solve them. As my first game, this project gave me confidence to work on bigger projects in the future.

I believe this experience will help me in my future studies and career in CSE. It also taught me the importance of planning, patience, creativity, and regular practice. Most importantly, completing my first game gave me a feeling of achievement and showed me that I can build something from an idea and turn it into a real working project.
